

Tuples in Python Welcome! This notebook will teach you about the tuples in the Python Programming Language. By the end of this lab, you'll

know the basics tuple operations in Python, including indexing, slicing and sorting.

  Estimated time needed: 15 min
About the Dataset
Imagine you received album recommendations from your friends and compiled all of the recommandations into a table, with
specific information about each album.
```

• artist - Name of the artist • album - Name of the album

The dataset can be seen below:

• released_year - Year the album was released • length_min_sec - Length of the album (hours,minutes,seconds) • genre - Genre of the album

music_recording_sales_millions - Music recording sales (millions in USD) on <u>SONG://DATABASE</u>

• claimed_sales_millions - Album's claimed sales (millions in USD) on SONG://DATABASE • date_released - Date on which the album was released

The table has one row for each movie and several columns:

- soundtrack Indicates if the album is the movie soundtrack (Y) or (N) • rating_of_friends - Indicates the rating from your friends from 1 to 10
- Artist Album Released Length Genre Music recording sales (millions) Claimed sales (millions) Released Soundtrack Rating (friends) Michael Jackson Thriller 1982 00:42:19 Pop, rock, R&B 46 65 30-Nov-82 10.0 AC/DC Back in Black 1980 00:42:11 Hard rock 26.1 50 25-Jul-80 8.5 Pink Floyd The Dark Side of the Moon 1973 00:42:49 Progressive rock 24.2 45 01-Mar-73 9.5 Whitney Houston The Bodyguard 1992 00:57:44 Soundtrack/R&B, soul, pop 26.1 50 25-Jul-80 Y 7.0 Meat Loaf
- Bat Out of Hell 1977 00:46:33 Hard rock, progressive rock 20.6 43 21-Oct-77 7.0 Eagles Their Greatest Hits (1971-1975) 1976 00:43:08 Rock, soft rock, folk rock 32.2 42 17-Feb-76 9.5 Bee Gees Saturday Night Fever 1977 1:15:54 Disco 20.6 40 15-Nov-77 Y 9.0 Fleetwood Mac Rumours 1977 00:40:01 Soft rock 27.9 40 04-Feb-77 9.5

In Python, there are different data types: string, integer and float. These data types can all be contained in a tuple as follows: 'disco int str

Now, let us create your first tuple with string, integer and float.

Tuples

In []: # Create your first tuple

We can print out each value in the tuple:

In []: # Print the variable on each index

-2

print(tuple1[0]) print(tuple1[1]) print(tuple1[2]) We can print out the type of each value in the tuple: In []: # Print the type of value on each index print(type(tuple1[0]))
print(type(tuple1[1])) print(type(tuple1[2]))

"disco"

10

1.2

Tuple1[-3]= "disco"

Tuple1[-2]= 10

Tuple1[-1]= 1.2

2

We can also use negative indexing. We use the same table above with corresponding negative values:

```
We can obtain the last element as follows (this time we will not use the print statement to display the values):
In [ ]: # Use negative index to get the value of the last element
         tuple1[-1]
         We can display the next two elements as follows:
In [ ]: # Use negative index to get the value of the second last element
         tuple1[-2]
In [ ]: # Use negative index to get the value of the third last element
         tuple1[-3]
         Concatenate Tuples
         We can concatenate or combine tuples by using the + sign:
In [ ]: # Concatenate two tuples
         tuple2 = tuple1 + ("hard rock", 10)
```

("disco", 10, 1.2, "hard rock", 10)

3

0 1

We can slice tuples, obtaining new tuples with the corresponding elements:

Slicing

We can slice tuples obtaining multiple values as demonstrated by the figure below:

```
In [ ]: # Slice from index 0 to index 2
       tuple2[0:3]
       We can obtain the last two elements of the tuple:
In [ ]: # Slice from index 3 to index 4
       tuple2[3:5]
       We can obtain the length of a tuple using the length command:
In [ ]: # Get the length of tuple
       len(tuple2)
       This figure shows the number of elements:
                 ("disco", 10, 1.2, "hard rock", 10)
```

3

4

Sorting Consider the following tuple:

Ratings = (0, 9, 6, 5, 10, 8, 9, 6, 2)

RatingsSorted = sorted(Ratings)

We can sort the values in a tuple and save it to a new tuple:

In []: # A sample tuple

In []: # Sort the tuple

RatingsSorted

Nested Tuple

```
In [ ]: # Create a nest tuple
          NestedT =(1, 2, ("pop", "rock"),(3,4),("disco",(1,2)))
         Each element in the tuple including other tuples can be obtained via an index as shown in the figure:
                   NT =(1, 2, ("pop", "rock"),(3,4),("disco",(1,2)))
                                            1
                                      0
In [ ]: # Print element on each index
          print("Element 0 of Tuple: ", NestedT[0])
         print("Element 1 of Tuple: ", NestedT[1])
print("Element 2 of Tuple: ", NestedT[2])
print("Element 3 of Tuple: ", NestedT[3])
print("Element 4 of Tuple: ", NestedT[4])
```

NT =(1, 2, ("pop", "rock"),(3,4),("disco",(1,2)))

NT[3]

(3,4)

NT[4]

NT[3][0] NT[3][1] NT[4][0] NT[4][1]

NT[4]

NT[4]

NT[4][1][0]

("disco",(1,2))

NT[4][0] NT[4][1]

("disco",(1,2))

NT[4][0] NT[4][1]

NT[4][1][1]

"disco"

("disco",(1,2))

"disco"

A tuple can contain another tuple as well as other more complex data types. This process is called 'nesting'. Consider the following tuple with several elements:

print("Element 4, 0 of Tuple: ",
print("Element 4, 1 of Tuple: ", We can access strings in the second nested tuples using a third index: In []: # Print the first element in the second nested tuples NestedT[2][1][0]

We can use a tree to visualise the process. Each new index corresponds to a deeper level in the tree:

"rock"

NT[2][1]

NT[2][1][1]

NT[2]

("pop", "rock")

NT[2]

("pop", "rock")

"pop"

NT[2][0]

NT[2][1][0]

Find the length of the tuple, genres_tuple:

Quiz on Tuples

Consider the following tuple:

In []: # sample tuple

genres_tuple

"rock"

NT[2][1]

NT[2][1][1]

"pop"

NT[2][0]

NT[2][1][0]

NestedT[4][0])

We can use the second index to access other tuples as demonstrated in the figure:

("pop", "rock")

"pop"

NT[2][0]

In []: # Print element on each index, including nest indexes

In []: # Print the second element in the second nested tuples

We can access the nested tuples :

print("Element 3, 0 of Tuple: print("Element 3, 1 of Tuple: ",

 ${\tt NestedT[2][1][1]}$

"rock"

NT[2][1]

```
NT[4][1][1]
                                                                                                          © 2017 IBM Corporation
        Similarly, we can access elements nested deeper in the tree with a fourth index:
In [ ]: # Print the first element in the second nested tuples
        NestedT[4][1][0]
In [ ]: # Print the second element in the second nested tuples
        NestedT[4][1][1]
        The following figure shows the relationship of the tree and the element <code>NestedT[4][1][1]</code>:
                    NT =(1, 2, ("pop", "rock"),(3,4),("disco",(1,2)))
```

NT[3]

(3,4)

NT[3][0] NT[3][1]

NT =(1, 2, ("pop", "rock"),(3,4),("disco",(1,2)))

NT[3]

(3,4)

NT[3][0] NT[3][1]

NT[4][1][0]

In []: # Write your code below and press Shift+Enter to execute 0 1 2 3 4 5 6 7 ("pop", "rock", "soul", "hard rock", "soft rock", "R&B", "progressive rock", "disco") Double-click here for the solution. Access the element, with respect to index 3: In []: # Write your code below and press Shift+Enter to execute

work. The best way to share and showcase your work is to share it on GitHub. By sharing your notebook on GitHub you are not only building your reputation with fellow data scientists, but you can also show it off when applying for a job. Even though this was your first piece of work, it is never too early to start building good habits. So, please read and follow this
